gnmidi 2.47 full en.rar .Q:
Mapping elements in a
dictionary of lists to
multiple lists A full
background is at the bottom

of the question. I have a dictionary, which is like a sparse 2-D array of integers: `z1, z2, z3, z4 = [3, 3, 4, 6, 5, 5]` I want to add the elements of `z1` to another 3 lists: `x = [1, 2]` `y = [3]` `z = [[1, 2], [3]]` I know there is a specialised way of mapping elements in a dictionary to tuples, e.g. `z1, z2, z3, z4 = {1: 3, 2: 4, 3: 5, 4: 6}` `x = [1, 2]` `y = [3]` `z = [(1, 3), (2, 4), (3, 5)]` I want the same result from the dictionary. A: To your question: "I know there is a specialised way of mapping elements in a dictionary to tuples, e.g." Then use tuple unpacking and list comprehension.

```
>>> x, y, z = zip(*(('A', i)
```

```
for i in z1)) >>> x ('A',  
1, 2) >>> y ('A', 3) >>> z  
[('A', 1, 2), ('A', 3)] x  
and y are list of tuples, z  
a list of list of tuples.
```

But I think that there is no standard way to do that, because to map to a list is well-defined, but with a dictionary is not well-defined. For example: >>>

```
{'x':x, 'y':y} {'x': ['A',  
1, 2], 'y': ['A', 3]} >>>  
{'x':x, 'y':y}['y']
```

```
Traceback (most recent call  
last): File "", line 1, in  
KeyError: 'y' 570a42141b
```
